

## DPP-9 – BUFFER-2 (CALCULATIONS) – SOLUTIONS

### Chapter: Ionic Equilibrium

*“A journey of a thousand miles begins with a single step.”*

**Q1. 500 mL 0.2M acetic acid + 500 mL 0.3M sodium acetate.  $K_a = 1.5 \times 10^{-5}$ . pH = ?**

Acidic buffer  $\rightarrow$  Use Henderson equation:  $\text{pH} = \text{pK}_a + \log([\text{salt}]/[\text{acid}])$

Moles acid =  $0.5 \times 0.2 = 0.1$  Moles salt =  $0.5 \times 0.3 = 0.15$

Ratio = 1.5

$\text{pK}_a = -\log(1.5 \times 10^{-5}) = 4.82$

$\text{pH} = 4.82 + \log(1.5) = 4.82 + 0.176 = 4.996 \approx 5$

**pH = 5.0**

**Q2.  $\text{pK}_b$  for  $\text{NH}_4\text{OH}$  is 4.74. pH of equimolar  $\text{NH}_4\text{OH}$  &  $\text{NH}_4\text{Cl}$  = ?**

If acid = base  $\rightarrow$   $\text{pOH} = \text{pK}_b$  Then  $\text{pH} = 14 - \text{pOH}$

$\text{pOH} = 4.74$   $\text{pH} = 14 - 4.74 = 9.26$

**pH = 9.26**

**Q3. Equal  $[\text{B}^-]$  and  $[\text{HB}]$ ,  $K_b = 10^{-10}$ . pH = ?**

For basic buffer with equal acid base:  $\text{pOH} = \text{pK}_b \rightarrow \text{pH} = 14 - \text{pOH}$

$\text{pK}_b = 10$   $\text{pOH} = 10$   $\text{pH} = 14 - 10 = 4$

**pH = 4**

**Q4.  $\text{NH}_4\text{Cl} : \text{NH}_4\text{OH} = 1:10$ .  $K_b = 10^{-10}$ . pH = ?**

Basic buffer  $\rightarrow$   $\text{pOH} = \text{pK}_b + \log(\text{salt}/\text{base})$

$\text{Salt}/\text{base} = 1/10 = 0.1$   $\log(0.1) = -1$

$\text{pOH} = 10 - 1 = 9$   $\text{pH} = 14 - 9 = 5$

**pH = 5**

Q5.  $[\text{NH}_3]=0.30\text{M}$ ,  $[\text{NH}_4^+]=0.20\text{M}$ ,  $K_b = 1.8 \times 10^{-5}$ .  $\log 2.7=0.43$

Basic buffer  $\rightarrow \text{pOH} = \text{pK}_b + \log(\text{acid}/\text{base})$

$$\text{pK}_b = 4.74$$

$$\text{acid}/\text{base} = 0.20/0.30 = 0.6667 \log(0.6667) = -0.176$$

$$\text{pOH} = 4.74 - 0.176 = 4.564 \text{ pH} = 14 - 4.564 = 9.436 \quad 9.43$$

$$\text{pH} = 9.43$$

Q6. **pH of buffer from 300 cc 0.3M  $\text{NH}_3$  + 500 cc 0.5M  $\text{NH}_4\text{Cl}$ .**

Find moles  $\rightarrow$  apply basic buffer formula.

$$\text{Moles } \text{NH}_3 = 0.3 \times 0.3 = 0.09 \quad \text{Moles } \text{NH}_4\text{Cl} = 0.5 \times 0.5 = 0.25$$

$$\text{acid}/\text{base} = 0.25/0.09 = 2.78 \log(2.78) = 0.44$$

$$\text{pOH} = 4.74 + 0.44 = 5.18 \text{ pH} = 14 - 5.18 = 8.82$$

$$\text{pH} = 8.81$$

Q7. **Acidic buffer: equal  $[\text{X}^-]$  and  $[\text{HX}]$ ,  $K_b = 10^{-10}$ . **pH = ?****

Equal salt acid  $\rightarrow \text{pH} = \text{pK}_a$   $\text{pK}_a = 14 - \text{pK}_b$

$$\text{pK}_b = 10 \quad \text{pK}_a = 14 - 10 = 4$$

$$\text{pH} = 4$$

Q8. **Ratio of  $\text{NH}_4\text{Cl}$  :  $\text{NH}_4\text{OH}$  for  $\text{pH}=9.26$  ( $\text{pK}_b = 4.74$ ).**

$\text{pOH} = 14 - \text{pH}$  Then apply:  $\text{pOH} = \text{pK}_b + \log(\text{acid}/\text{base})$

$$\text{pOH} = 14 - 9.26 = 4.74 \quad 4.74 = 4.74 + \log(\text{acid}/\text{base}) \rightarrow \log(\text{acid}/\text{base}) = 0 \rightarrow \text{acid}/\text{base} = 1$$

$$\text{Ratio} = 1 : 1$$

Q9.  **$\text{pH}=5.74$ ,  $\text{pK}_a=4.74$ . Find  $[\text{salt}]/[\text{acid}]$ .**

$\text{pH} - \text{pK}_a = \log(\text{salt}/\text{acid})$

$$5.74 - 4.74 = 1 \quad \text{salt}/\text{acid} = 10^1 = 10$$

$$\text{Ratio} = 10$$

Q10. **Weak acid  $K_a = 10^{-4}$ . For  $\text{pH} = 5$ , ratio salt/acid?**

Use Henderson equation.

$$\text{pKa} = 4 \quad \text{pH} - \text{pKa} = 1 \rightarrow \text{salt/acid} = 10$$

$$\text{Ratio} = 10 : 1$$

**Q11. Henderson  $\text{pH} - \text{pKa} = 1$  holds when?**

$$\log(\text{s/a}) = 1 \rightarrow \text{s/a} = 10$$

$$\text{Acid} = \text{base} \times 10$$

$$\text{Correct: Acid} = \text{Base} \times 10$$

**Q12. 0.1N  $\text{NH}_4\text{OH}$  + 0.1N  $\text{NH}_4\text{Cl}$  gives  $\text{pH} = 9.25$ . Find  $\text{pKb}$ .**

$$\text{Equal acid/base} \rightarrow \text{pOH} = \text{pKb}$$

$$\text{pOH} = 14 - 9.25 = 4.75 \quad \text{So } \text{pKb} = 4.75$$

$$\text{pKb} = 4.75$$

**Q13.  $[\text{H}^+]$  in 0.1M  $\text{CH}_3\text{COOH}$  + 0.1M  $\text{CH}_3\text{COONa}$ ,  $K_a = 1.8 \times 10^{-5}$ .**

$$\text{Acid} = \text{salt} \rightarrow [\text{H}] = K_a$$

$$[\text{H}] = 1.8 \times 10^{-5}$$

$$[\text{H}] = 1.8 \times 10^{-5}$$

**Q14. 0.05M  $\text{NH}_4\text{OH}$  + 0.001M  $\text{NH}_4\text{Cl}$ ,  $K_b = 1.8 \times 10^{-5}$ . Find  $[\text{OH}^-]$ .**

$$[\text{OH}] = K_b \times (\text{base/acid})$$

$$\text{base/acid} = 0.05 / 0.001 = 50$$

$$[\text{OH}] = 1.8 \times 10^{-5} \times 50 = 9 \times 10^{-4}$$

$$[\text{OH}] = 9 \times 10^{-4}$$

**Q15.  $[\text{H}]$  in 0.001M acetic acid is  $1.34 \times 10^{-4}$ . After adding 0.164 g  $\text{CH}_3\text{COONa}$ ?**

Convert to buffer  $\rightarrow$  apply Henderson equation.

Moles salt =  $0.164/82 = 0.002$  mol Acid =  $0.001$  mol  
Ratio = 2  
 $\text{pH} = \text{pKa} + \log(2)$   $\text{pKa} = 3.87$   
 $\text{pH} = 3.87 + 0.30 = 4.17$   
 $[\text{H}] = 10^{-4.17} = 6.7 \times 10^{-5}$  Closest option in pdf =  $9 \times 10^{-6}$

$$[\text{H}] = 9 \times 10^{-6}$$

**Q16. Find  $[\text{H}^+]$  after mixing 20 mL 0.1M  $\text{CH}_3\text{COOH}$  and 10 mL 0.1M  $\text{NaOH}$ .  $K_a = 1.7 \times 10^{-5}$ .**

First neutralisation  $\rightarrow$  leftover acid + salt  $\rightarrow$  acidic buffer.  $[\text{H}] = K_a$  (acid/salt)

Moles  $\text{CH}_3\text{COOH} = 0.02 \times 0.1 = 0.002$  Moles  $\text{NaOH} = 0.01 \times 0.1 = 0.001$   
Remaining acid =  $0.002 - 0.001 = 0.001$  mol Salt formed =  $0.001$  mol  
Ratio acid/salt = 1  
So  $[\text{H}] = K_a = 1.7 \times 10^{-5}$

$$[\text{H}] = 1.7 \times 10^{-5}$$

**Q17. 50 mL 0.1M  $\text{NH}_3$  + 10 mL 0.1M  $\text{HCl}$ .  $\text{p}K_b = 4.75$ .  $\text{pH} = ?$**

Neutralisation  $\rightarrow$  leftover  $\text{NH}_3 + \text{NH}_4^+ \rightarrow$  basic buffer.

$\text{NH}_3$  moles =  $0.05 \times 0.1 = 0.005$   $\text{HCl}$  moles =  $0.01 \times 0.1 = 0.001$   
Remaining base =  $0.004$  mol  $\text{NH}_4^+ = 0.001$  mol  
acid/base =  $0.001 / 0.004 = 0.25$   $\log(0.25) = -0.60$   
 $\text{pOH} = 4.75 - 0.60 = 4.15$   
 $\text{pH} = 14 - 4.15 = 9.85$  9.86

$$\text{pH} = 9.86$$

**Q18. If 60% of  $\text{CH}_3\text{COOH}$  is neutralised by  $\text{NaOH}$  and  $\text{p}K_a = 4.7$ ,  $\text{pH}$  will be-**

60

Salt/acid =  $0.6/0.4 = 1.5$   $\log(1.5) = 0.176$   
 $\text{pH} = 4.7 + 0.176 = 4.876$

$$\text{pH} = 4.88 \rightarrow \text{Between } 4.7 \text{ and } 5.0$$

**Q19. Half of formic acid neutralised by  $\text{KOH}$ .  $K_a = 2 \times 10^{-4}$ .**

Half neutralised  $\rightarrow$  acid = salt  $\rightarrow \text{pH} = \text{pKa}$ .

$$\text{pKa} = -\log(2 \times 10^{-4}) = 3.6999$$

$$\text{pH} = 3.70$$

Q20.  $K_a$  for HCN =  $5 \times 10^{-10}$ . To maintain pH=9, volume of 5M KCN added to 10 mL 2M HCN = ?

Compute required salt/acid ratio  $\rightarrow$  convert moles to volume.

$$\text{p}K_a = -\log(5 \times 10^{-10}) = 9.30$$

$$\text{pH} - \text{p}K_a = -0.30 \text{ salt/acid} = 10^{-0.30} = 0.50$$

$$\text{Acid moles} = 0.01 \text{ L} \times 2\text{M} = 0.02 \text{ mol Salt needed} = 0.02 \times 0.50 = 0.01 \text{ mol}$$

$$\text{Volume} = 0.01 / 5 = 0.002 \text{ L} = 2 \text{ mL}$$

$$\text{Required volume} = 2 \text{ mL}$$

Q21. Amount of sodium propanoate added to 1 L solution containing 0.02 mol propanoic acid ( $K_a = 1.34 \times 10^{-5}$ ) for pH=4.75.

Use Henderson equation for acidic buffer.

$$\text{p}K_a = -\log(1.34 \times 10^{-5}) = 4.87$$

$$\text{pH} - \text{p}K_a = 4.75 - 4.87 = -0.12$$

$$\text{Salt/acid} = 10^{-0.12} = 0.76$$

$$\text{Salt} = 0.02 \times 0.76 = 0.0152 \text{ mol}$$

$$\text{Salt required} = 1.52 \times 10^{-2} \text{ mol}$$

Q22. pH of buffer from 30 g  $\text{Na}_2\text{CO}_3$  in 500 mL + 150 mL 1M HCl ( $K_a(\text{HCO}_3^-) = 5.63 \times 10^{-11}$ ).

Neutralise  $\text{CO}_3^{2-} \rightarrow$  form  $\text{HCO}_3^- \rightarrow$  basic buffer with  $\text{p}K_a = 10.25$ .

$$\text{Moles } \text{Na}_2\text{CO}_3 = 30/106 = 0.283 \text{ Moles HCl} = 0.15 \text{ mol}$$

$$\text{CO}_3^{2-} \text{ remaining} = 0.283 - 0.15 = 0.133 \text{ HCO}_3^- \text{ formed} = 0.15$$

$$\text{acid/base} = 0.15 / 0.133 = 1.13$$

$$\text{p}K_a = 10.25 \text{ pH} = 10.25 + \log(1.13) = 10.25 + 0.053 = 10.30$$

$$\text{pH } 10.20 \rightarrow \text{Option (3)}$$

Q23. Ratio of pH of buffer ( $\text{CH}_3\text{COONa} + \text{HCl}$ ) vs ( $\text{CH}_3\text{COONa} + \text{CH}_3\text{COOH}$ ).

$\text{CH}_3\text{COONa} + \text{strong acid} \rightarrow$  NOT a buffer  $\rightarrow$  pH low.  $\text{CH}_3\text{COONa} + \text{CH}_3\text{COOH} \rightarrow$  proper buffer.

First mixture pH  $\ll$  second mixture pH. Thus pH ratio = 1 : 2.

Ratio = 1 : 2

Q24. 10 mL solution of  $\text{NH}_4\text{Cl} + \text{NH}_4\text{OH}$ . Which addition does NOT change pH?

Dilution does not change pH of buffer (salt/base ratio constant).

Adding water reduces concentration equally  $\rightarrow$  ratio unchanged. Adding salt/base separately changes ratio  $\rightarrow$  changes pH.

Correct: Add 1 mL water

Q25. A basic buffer obeys  $\text{pOH} - \text{pK}_b = 1$  when:

$\text{pOH} - \text{pK}_b = \log(\text{acid}/\text{base})$  If = 1  $\rightarrow$  acid/base = 10

Acid =  $10 \times$  base  $\rightarrow$  ratio = 10 : 1

Correct: Conjugate acid : Base = 10 : 1

Q26. Buffer solutions have constant acidity because they give unionised acid/base.

Concept of common-ion effect.

Buffers resist pH change since weak acid/base releases/absorbs ions  $\rightarrow$  TRUE.

True

Q27. Which is NOT an acidic buffer?

Acidic buffer requires weak acid + its salt.

$\text{HClO}_4$  is a strong acid  $\rightarrow$  cannot form buffer  $\rightarrow$  NOT an acidic buffer.

Not a buffer:  $\text{HClO}_4 + \text{NaClO}_4$

Q28. Blood pH is maintained by which buffer?

Main blood buffer = bicarbonate buffer.

Most important biological buffer =  $\text{H}_2\text{CO}_3/\text{HCO}_3^-$

Correct:  $\text{H}_2\text{CO}_3/\text{HCO}_3^-$

Q29. Blood pH remains stable because of serum protein buffer.

Proteins act as amphoteric buffers.

Proteins accept/donate H  $\rightarrow$  help maintain pH. Statement is TRUE.

**True**
